

IN THE CLAIMS

1. A ventilation apparatus for mounting in a garage door including:
- a rectangular shaped base support member having an opening formed therein;
 - a first rectangular shaped tracking member having an opening formed therein, aligned in the first portions of the opening in the base support member;
 - a first transparent member coupled in the opening in the first tracking member;
 - a second rectangular shaped tracking member having an opening formed therein aligned in first and second portions of the opening in the base support member adjacent the first tracking member;
 - a second transparent member mounted for slidable movement in the opening in the second tracking member so that the second transparent member can be moved to a position so that the second portions of the opening in the base support member are covered and can be moved so that the second portions of the opening in the base support member are open;
 - a plurality of predetermined spaced apertures formed in the rectangular shaped base support member for aligning and facilitating the attaching of the rectangular shaped base support member to an upper most panel of the garage door; and
 - a plurality of fastening members one of the plurality to be mounted in a predetermined one of the spaced apertures in the rectangular shaped base support member for attaching the rectangular shaped base support member to the uppermost panel of the garage door.
-

3. A ventilation apparatus as defined in Claim 2 wherein the base support member which includes:

a first pair of spaced aligned horizontally extending members;

a first pair of spaced aligned vertically extending members, one of the vertically extending members being coupled between each end portion of the pair of horizontally extending members so that the opening in the base support member is formed therebetween; and

A² an intermediate vertically extending member coupled between the pair of spaced horizontally extending members so that the opening formed between the pair of horizontally extending and vertically extending members is provided with a first and a second portion.

4. A ventilation apparatus as defined in Claim 3 wherein the base support member further includes:

a second pair of spaced aligned horizontally extending members, each one of the second pair of horizontally extending members being perpendicularly coupled to one of the first pair of horizontally extending members; and

a second pair of spaced vertically extending members, each one of the second pair of vertically extending members being perpendicularly coupled to one of the first pair of vertically extending members.

10. A ventilation apparatus for mounting in a garage door including:

a rectangular shaped base support member having an opening formed therein, the base support member including a first pair of spaced aligned horizontally extending members;

a first pair of spaced aligned vertically extending member, one of the vertically extending members being coupled between each end portion of the pair of horizontally extending members so that the opening in the base support member is formed therebetween;

A3 an intermediate vertically extending member coupled between intermediate portions of the pair of spaced horizontally extending members so that the opening formed between the pair of horizontally extending and vertically extending members is provided with a first and a second portion;

a second pair of spaced aligned horizontally extending members, each one of the second pair of horizontally extending members being perpendicularly coupled to one of the first pair of horizontally extending members;

a second pair of spaced vertically extending members, each one of the second pair of vertically extending members being perpendicularly coupled to one of the first pair of vertically extending members.

a first rectangular shaped tracking member having an opening formed therein, aligned in the opening in the base support member;

a first transparent member slidably coupled in the opening in the first tracking member so that the first transparent member can be moved to a position so first portions

of the opening in the base support member are closed and can be moved to another position so that the opening is open;

a second rectangular shaped tracking member having an opening formed therein aligned in the opening in the base support member adjacent the first tract member;

Q3 cont
a second transparent member mounted for slidable movement in the opening in the second tracking member so that the second member can be moved to a position to cover the second portions of the opening in the base support member and so that the second transparent member can be moved to a position so that the second portions of the opening in the base support member is open;

a plurality of predetermined spaced apertures formed in the rectangular shaped base support member for aligning and facilitating the attaching of the rectangular shaped base support member to an upper most panel of the garage door; and

a plurality of fastening members one of the plurality to be mounted in a predetermined one of the spaced apertures in the rectangular shaped base support member for attaching the rectangular shaped base support member to the uppermost panel of the garage door.

13. A ventilation apparatus as defined in Claim 10 wherein the first tracking member includes:

W
a first pair of spaced aligned horizontally extending tracks each one of the tracks being coupled to one of the second horizontally extending members; and

a first pair of spaced aligned vertically extending tracks one of the vertically extending tracks being coupled between each outermost end portion of the pair of horizontally extending tracks on an adjacent one of the second pair of spaced vertically extending members.
